

Description

Your task is to implement hierarchical UI based on given product data. Initial product data is delivered in attached **responseData.json** file.

UI loads the initial data and implements following functionalities:

- User can add new categories
- User can add new products/brands
- User can delete existing categories
- User can delete existing products/brands

You can use ReactJS (Redux for state management)

Data should be loaded from provided file - either from locally stored file, or if you locate test on server, then from server. Things shouldn't be saved on server, just in memory (web browser).

There is a picture of what we expect to see approximately – don't concentrate on design. What we need to see is JavaScript and overall programming skills
